BullionEdge PRO

Your first trade, in eight steps.

A pre-trade desk for gold. It will not tell you what to buy — it tells you whether the trade you already want to take is worth taking, and exactly how large it should be.

Plus, on the last page: how to check a copy-trade signal before you follow it.

1

Get in

You need a licence key. There are three ways to hold one.

- **Subscribe.** Week Pass $9.99 / 7 days · Starter $31.99 / 30 days · Pro $89.99 / 90 days · Elite $159.99 / 180 days. Pay at the checkout and your key is emailed the moment payment clears. It renews at the same price until you cancel, which takes one click from your account page.
- **Open a broker account.** Fund a new XM account, get a week on the desk — fund a new XM account through our link with $100+, send proof, and get 7 days free. It becomes a paid subscription afterwards unless you cancel during the week.
- **Already have a key?** Go straight to step 2.

> **Activating.** On the login screen open **Activate licence**, paste the key, choose a User ID and a passkey. The key is confirmed with the payment provider and bound to that device, then re-checked about once a week — in between, the desk works with no connection at all.

> **Never reuse a banking or broker password here.** This is a local profile in one browser, not a secure cloud account. It does not sync, and clearing site data removes it.

2

Set two numbers, once

Everything the desk ever tells you is derived from these. Get them right and you never touch them again.

- **Account balance** — the real figure, not the one you wish it was.
- **Risk per trade** — start at 0.5%. Step 7 shows what happens when it is higher.
- **Timezone** — every session window and news time is redrawn into your local clock.

> **Check your broker's contract spec.** The defaults assume a 1.00 gold move is worth $100 per standard lot. Indices and crypto have no industry standard at all — brokers differ by a factor of ten. Get this wrong and every position size is wrong.

3

Read the market

Open **Live**. Gold spot, a candle chart, and four rules-based setups — one per trading style.

- Pick your style — scalping, day, swing or position. The chart timeframe follows.
- Each setup gives a bias, an entry, a stop and two targets, plus an **HTF ✓** flag showing whether it agrees with the daily trend.
- Setups freeze for two hours on purpose, so you cannot refresh until one agrees with you.

> **Trade windows, in UTC.** Window 1 London 7:00–10:00 · Window 2 US overlap 12:00–15:00 · Window 3 Asian 0:00–7:00. The app shows these in your own timezone.

4

Load it, or type your own

One click sends a setup to the analyser. Or ignore them and enter your own levels.

- **Load the highlighted setup** fills in direction, entry, stop and target.
- **Use the live price** drops the current gold price in so you can build around it.
- Either way it still has to earn the same score as anything else. Nothing is pre-approved because a machine suggested it.

> **One market, all the way through.** The price feed, the generated setups, the session windows and the sizing are all XAU/USD. There is no instrument to pick and nothing to switch — the whole desk is tuned to gold's volatility, which is exactly why its numbers mean something.

5

Let it size the trade

You never pick a lot size. Nominate the risk and the size falls out of your stop.

```
$25.00 risk  ÷  $400 per lot  =  0.0625  →  0.06 lots
```

$5,000 account at 0.5% is $25.00 a trade. A 40-pip gold stop is worth $400 per lot. Lots round **down**, never up — so real risk is $24.00, under budget rather than over.

6 Read the working, not just the verdict

Ten weighted components, each showing what it scored out of what it could. There is nothing to fill in.

- Every line is measured from candles that have already closed. Nothing here is a forecast, and nothing waits on you to confirm it.
- The rows are the arithmetic behind the number at the top — so a score of 85 can be checked rather than trusted.
- Then answer the **Psychology** questions. Those are still asked, because they are the one thing candle data cannot answer: revenge trading, exhaustion or extreme stress block the trade outright.

> **Disagreeing with it is the point of showing it.** The app cannot see what you can see. If a level on your own chart contradicts what it found, that is worth more than the score is.

7 Read the verdict

Four possible answers, the reasons behind each, and the exact position size.

REWARD : RISK	WIN RATE NEEDED TO BREAK EVEN
1 : 1	50.0%
1 : 1.5	40.0%
1 : 2	33.3%
1 : 2.5	28.6%
1 : 3	25.0%

At 1:2.5 you only need to be right 28.6% of the time. That is why the desk argues with you below 1:1.5 — the same accuracy is profitable or not depending entirely on this number.

> **A skipped trade costs nothing.** Weekend, news inside 15 minutes, daily limit reached, a position too small to place, or an honest psychology answer — each overrides the score outright.

8

Place it, then log it

This is where you leave. BullionEdge Pro plans and sizes trades — it has no broker connection and cannot place an order.

- Copy the lot size, stop and targets into your own platform by hand.
- Set the stop **before** you enter. Move it to break-even at 1R. Never widen it.
- When the trade closes, log the result in R, the emotion, and the mistake — especially on winners.

> **After twenty closed trades it stops guessing about you.** The probability figure re-anchors on your own win rate and expectancy, and the dashboard starts showing which session and which style actually pay for you.

Copying someone else's trades

Copy trading outsources the analysis. It does not outsource the risk — that stays entirely yours, and so does the loss. The **Copy trade** tab scores whether you actually know what you are about to copy, before you copy it. Open it, answer six questions, type in the four numbers the provider publishes, and read the band.

Six questions. Answer them honestly, not hopefully.

1. Do I understand this setup myself?
2. Did I verify the reward-to-risk myself?
3. Is there a defined stop-loss on this trade?
4. Did I check the news calendar for this window?
5. Did I check my own spread and fees?
6. Do I have real evidence this trader is credible?

> **"Is there a defined stop-loss?" is not scored like the others.** Answer no and the score is capped at 30 however good everything else looks. A copied trade with no stop is an open-ended loss on someone else's judgement, and there is no position size that makes that safe.

Four numbers to demand before you pay anyone

ASK FOR	WHAT A BAD ANSWER LOOKS LIKE
Published max drawdown	Anything above 30% means one bad month can halve your account.
Published win rate	On its own this number is meaningless without average R.
Published average R:R	Below 1R the strategy needs a very high win rate to survive costs.
Verified track record	Under 6 months of live results is noise, not evidence.

A worked example — the trap this catches

A provider advertises a **75% win rate**. Three trades in four. Their other published figures: 45% max drawdown, 0.3 average R, four months of history. You have verified none of it yourself, but there is a stop-loss. Type that in and the validator returns:

```
Safety score 24 / 100  ·  band RED  ·  Do not copy this. Too much is unverified or the published record does not stand up.
```

> Max drawdown of 45% means a losing streak can take a third or more of your capital. Size accordingly, or not at all.
>
> Average R of 0.3 means every loss costs more than a win makes. That needs a win rate above 77% just to break even.
>
> 4 months of history is well inside the range that luck explains. Wait for more.

> Their own published numbers produce a negative expectancy of -0.03R per trade. On the provider's own figures this strategy loses money.

That last line is the whole point. At 0.3 average R you need to win **76.9%** of the time simply to break even — so 75% is losing, by a hair, on the provider's *own published figures*. Nobody spots that gap by eye. It takes two numbers and one multiplication, and almost nobody does it before subscribing.

Reading the band

SCORE	BAND	WHAT TO DO
75–100	**Green**	Copy at your normal risk — never more because someone else is confident.
50–74	**Amber**	Reduced size only, if at all. There are gaps in what you have verified.
0–49	**Red**	Do not copy. Go and find the missing answers first.

> **Size it yourself, always.** Whatever you decide, put the trade through the analyser like any other: your balance, your risk percentage, their entry and stop. Copying a provider's *lot size* is how a $500 account gets destroyed following a $50,000 one. Copy the idea; never copy the size.

Five rules that keep accounts alive

Risk a fixed small percentage · stop set before entry, never widened · trade inside a window · two trades a day then stop · log everything, including the ugly ones.
