

Giving someone free full access

There is no admin panel and no server, so there is no "create account" button for you to press. This is the whole procedure.

Why it works this way

An account is created on **the member's own device**. `ui/accounts.js` stores it in that browser's IndexedDB, and creating one requires activating a real Lemon Squeezy licence key. Nothing about a member exists centrally.

That is deliberate. The original build shipped 200 access keys as a literal table in the source, so the cheapest way into a paid product was to read a key off the page with View Source. Hardcoding three comp accounts would reopen exactly that hole — and because the build refuses to ship anything that looks like a credential, it would fail the secret scan on the way out.

Issuing real keys instead costs nothing, and it means a comp account behaves like every other account: it can be revoked, it obeys device limits, and it shows up in your dashboard beside the paying ones.

The procedure

1. Create the code

Lemon Squeezy → **Discounts** → New discount.

FIELD	VALUE
Name	<code>Friends</code> — internal only, buyers never see it
Code	something unguessable, e.g. <code>BEP-FRIENDS-7K2Q</code>
Type	Percent, <code>100</code>
Duration	Forever — "Once" charges them full price at the first renewal
Limit redemptions	Yes → 3. Without this, one shared screenshot gives your product away
Products	Restrict to the single plan you intend to give
Expires	Set a date. An immortal 100% code is a liability you will forget about

Set the redemption limit. It is the only thing standing between a private favour and a code circulating in a Telegram group.

2. Send them the checkout

They use the normal checkout link and enter the code:

```
https://bullionedgepro1.lemonsqueezy.com/checkout/buy/9651f021-389a-4a22-84b6-d82b5230e0f4
```

Lemon Squeezy may still ask for card details even at \$0, because the subscription renews. That is expected and nothing is charged while the discount is set to Forever.

3. They activate

The key arrives by email. On the sign-in screen they choose **Activate licence**, paste it, and pick their own User ID and passkey.

They choose the passkey, not you. It is stored as a PBKDF2 hash on their own device and cannot be recovered — if you set it for them you are handling a credential you have no way to reset.

4. Revoking

Lemon Squeezy → Licence keys → find the key → **Disable**. The desk closes at the next revalidation, within seven days. Their journal survives: entitlement and profile are stored separately precisely so a lapsed subscription does not destroy what someone wrote.

Test the loop first

Purchase → email → key → activation has never been run end to end. Before you issue three of anything, buy one Week Pass at \$9.99 yourself and walk it through. If the email does not arrive or the key does not activate, you want to find that out on your own \$9.99, not in front of three friends.

The message to send

I've got you a free account on the gold desk I've been building. 1. Go to <checkout link> 2. Enter the code **BEP-FRIENDS-7K2Q** — it takes it to \$0 3. You'll get a licence key by email 4. Open the app, choose "Activate licence", paste the key, and pick your own User ID and passkey One thing worth knowing before you start: it is built to refuse trades. If it says no on a setup you like, that is the product working, not a bug. Tell me when it annoys you — that is the useful feedback.

That last paragraph matters. Someone expecting signals will conclude it is broken within ten minutes; someone told in advance that refusal is the point evaluates the thing you actually built.
