

Lemon Squeezy account review — reply pack

Lemon Squeezy asked two things before approving store **448900** :

1. A demo video showing the product's functionality.
2. A specific description of what is being sold, how it is made and licensed, who it is for, and whether it is one-off or subscription.

The subtext of a review like this, for anything touching trading, is a compliance question: *is this a signal service, a managed account, or something that handles other people's money?* It is none of those, and the reply below says so plainly rather than waiting to be asked. Everything in it is checkable against the live site.

1. The email reply

Replace the bracketed parts before sending. Keep the live URL — the reviewer will click it, and the disclaimer they are looking for is already on that page.

Hi Lasya,

Thanks for coming back to me. Answers to both points below, and a demo video here: **[VIDEO LINK]**

What the product is

BullionEdge Pro is browser-based pre-trade analysis and journaling software for retail traders who trade gold (XAU/USD). It is one product, sold as a subscription, and it runs entirely in the customer's own browser.

You can see the whole thing here, no purchase needed:

<https://bullionedgepro.github.io/bullionedge-pro/>

The software does four things:

- **Pre-trade analysis.** It reads gold price candles and measures the setup the trader is already looking at against a fixed ten-factor rulebook — market structure, liquidity, gaps, momentum, session, reward-to-risk and so on — and returns a score out of 100 with the reasoning shown in full.
- **Risk and position sizing.** The trader enters their account balance and the percentage they are willing to risk, and the software calculates the position size at which being wrong costs exactly that amount.

- **A trading journal and statistics.** Every trade is logged with its result, R-multiple and the emotional state recorded at the time, and the dashboard reports on it over time.
- **Discipline limits.** The trader sets a daily loss limit and a maximum number of trades per day. When they hit either, the software refuses to approve further setups for the rest of the day.

What it explicitly is not

I want to be direct about this, because it is the usual concern with anything in this category:

- It is **not a signal service**. It does not tell anyone what to buy or sell, and it does not distribute trade calls.
- It is **not financial, investment or tax advice**, and it makes no personalised recommendations.
- It is **not a broker, fund, or managed-account service**. It never touches customer money, holds no funds, has no broker integration or API connection, and cannot place, modify or close a trade anywhere. The customer reads the analysis and then acts, or does not act, entirely in their own broker platform.
- It is **not copy trading**. The one screen that mentions the term is a validator that helps a trader scrutinise someone else's copy-trade offer before following it.
- It **makes no profit, income or win-rate claims**, express or implied. There are no earnings figures, no equity screenshots and no testimonials of returns anywhere on the site. A full risk warning stating that customers can lose some or all of their capital is in the footer of the landing page, above, and it is not hidden behind a link.
- It does **not predict prices**. Every number it produces is measured from candles that have already closed; nothing is projected forward.

How it is made and licensed

I built and own it outright. It is original code — plain JavaScript with no third-party trading library, no white-label platform, no resold or PLR product, and no licensed content from anyone else. It ships as a single self-contained web app with no backend server; the customer's trades and settings are stored in their own browser, and I hold no customer trading data.

Customers receive a licence key on purchase, which they activate in the app. Each key allows two device activations.

Who it is for

Retail traders who already trade gold with their own broker and want a structured process before entering — a checklist, honest position sizing, hard daily limits and a journal — instead of deciding by feel. It is aimed at people already in the market, not at beginners being promised an income.

Single purchase or subscription

All subscriptions, auto-renewing, four billing durations of the same product:

PLAN	PRICE	RENEWS
Week Pass	\$9.99	weekly
Starter	\$31.99	monthly
Pro	\$89.99	every 3 months
Elite	\$159.99	every 6 months

There are no one-off purchases, no upsells, no add-ons and no trials. Customers can cancel in one click from the Lemon Squeezy customer portal at any time; cancelling stops the next payment and leaves access running to the end of the period already paid for.

Support is [bullionedgepro@gmail.com], answered by me directly.

Happy to provide anything else that would help — screenshots, a walkthrough of any specific screen, or a test account.

Best regards,

[YOUR NAME]

[BUSINESS NAME / trading as, if any]

[COUNTRY]

2. The demo video

Aim for **2–3 minutes**, screen recording with your voice over it. It does not need editing or music. Record it on the live site so the reviewer can follow along at the same URL.

What a reviewer is checking: that the product exists, that it does what the sales page says, and that it is not a front for something else. Show the actual software working. Do not make it a sales pitch.

Tools: Windows Game Bar (**Win+G**) records the screen for free. Upload unlisted to YouTube or Google Drive and paste the link.

Shot list

TIME	SCREEN	WHAT TO SAY
0:00– 0:20	Landing page, scrolling slowly	"This is BullionEdge Pro. It's analysis and journaling software for traders who trade gold. It doesn't place trades and it doesn't give signals — I'll show you what it actually does."
0:20– 0:30	Scroll to the footer risk warning, pause on it	"The risk disclaimer is on the front page, not buried. No profit claims anywhere on the site."
0:30– 0:45	Log in	"Customers get a licence key after purchase and activate it here. Two devices per key."
0:45– 1:15	Risk screen — set balance and risk %	"First thing a customer does is set their account balance and how much they're willing to risk per trade. Everything else is calculated from these two numbers. They also set a daily loss limit and a maximum number of trades."
1:15– 2:00	XAU/USD screen — chart, then scroll through the checklist to the verdict	"This reads gold price candles and scores the setup against a fixed rulebook out of 100. Here's the reasoning — it shows every factor it counted and every one it didn't. Crucially, the score is not a probability of profit and the app says so. And here it's telling me not to take this one, because [read out whatever the actual verdict says]."
2:00– 2:15	Scroll to the position size	"It works out the lot size backwards from the loss the trader said they could accept. They then place that trade themselves, in their own broker. Nothing here connects to a broker and nothing here can execute anything."
2:15– 2:35	Click the  assistant, ask <i>"what does the confluence score mean?"</i>	"There's a built-in assistant that explains how the software works. It answers from a fixed set of topics on the device — it won't answer questions about where the market is going, by design."
2:35– 2:55	Journal , then Dashboard	"Trades get logged here with the result and the emotion recorded at the time, and the dashboard reports on it over the long run. That's the whole product — a process and a record, not a prediction."
2:55– 3:00	Stop	"Happy to show anything else. Thanks."

Things to avoid saying on camera

- Any figure for profit, returns, win rate or income — yours or a customer's.
- "Signals", "guaranteed", "passive income", "financial freedom".
- Showing a live broker account with a balance in it.
- Claiming a user count you cannot evidence.

Things worth saying explicitly

- "It never touches customer money."
- "It can't place a trade."
- "It doesn't predict prices."

- "There's no profit claim anywhere on the site."
-

3. Do not wire checkout in yet

`CHECKOUT.storeId` in `src/domain/licensing.js` stays empty until the account is approved and switched to live mode. A test-mode checkout takes no money but still issues a working licence key, so publishing those ids would hand free access to anyone who found the page.

Live mode issues a **different store id** and **different variant ids**. Swap those in, rebuild, redeploy — and only then. See `docs/PAYMENTS.md`.
