

BULLIONEDGE PRO

From sign-in to a placed trade.

The complete walkthrough of the XAU/USD pre-trade desk — what each screen is for, what it will not do for you, and where the decision stays yours.

Ten steps. Every screenshot taken from the live application on 2026-08-14.

Not financial advice. Analytical and journaling software. Not a signal service, not a broker, and not a promise of any outcome.

Read this before anything else

Trading gold with leverage is high-risk and you can lose some or all of your capital, including on news gaps that jump straight past your stop. This software does not predict prices, cannot place a trade, never touches your money, and promises no profit, income or win rate. It measures the setup in front of you against a fixed rulebook and enforces the limits you set. Every decision remains yours, and so does every outcome. Never trade with money you cannot afford to lose.

What this guide covers

The ten steps below are the whole workflow, in the order you will actually use them. It ends where it should — with you placing the trade on your own platform, deliberately.

- Sign in
- Set your money first
- Open the XAU/USD desk
- Work the checklist honestly
- Read the verdict — including the case against
- Take the plan: entry, stop, targets, size
- Ask the assistant
- Place it yourself, with your broker
- Log it — win, lose or skipped
- Watch the path, not the day

1

Sign in

Your licence key is emailed when you subscribe. It is checked in your browser, and it is the only thing standing between you and the desk.

BullionEdge PRO

AI-guided pre-trade analysis for high-probability setups.

Members only. Log in with your User ID, or activate the licence key from your subscription email.

Log in Activate licence

Enter the desk

[Back to the site](#)

Your profile is local; your subscription is not. The User ID, passkey, settings and journal live in this browser on this device — nothing syncs, and clearing site data deletes them, so use the backup export. Whether your subscription is paid for is checked with the payment provider, which is why cancelling closes the desk and renewing reopens it with your journal intact. Never reuse a real banking or broker password here. [Owner sign-in](#)

Screen continues below — scroll in the app.

- Paste the key on the login card and press **Enter the desk**. One key covers two devices — your laptop and your phone, typically.
- The clock on your access period starts when you *activate*, not when you paid.
- Everything past this point works with no network, so a dropped connection mid-session costs you nothing.

Worth knowing. If a key is refused, it has usually been activated on two devices already. Deactivate one from your account page rather than buying another.

2

Set your money first

Do this before anything else. Every number the app produces is derived from these two figures, and the defaults are not yours.

Screen continues below — scroll in the app.

- On the **Risk** screen, enter your real account balance and the percentage you are willing to lose on one trade.
- Set the daily loss limit and the maximum number of trades per day while you are calm. They are enforced later, when you are not.
- This is the screen that decides your position size. An honest balance here is worth more than any entry you will ever find.

Worth knowing. A risk percentage above 2% means a normal losing streak can end your account. The app will still let you set it. It will not pretend that is wise.

3

Open the XAU/USD desk

The chart, the structure read, and a price you can align to your own broker.

Screen continues below — scroll in the app.

- The engine reads closed candles and marks structure, imbalance, order blocks and liquidity pools. Nothing is drawn from the candle still forming, and the newest bar streams live without ever repainting.
- Open **Match my broker's price**, read the price off MT4/MT5 and type it in. Every level then lands on the same numbers your terminal shows. Until you do, one line above the chart says prices are indicative — it disappears once you have matched them.
- Switch chart layers on and off beneath the chart: order blocks, fair value gaps, liquidity pools, BOS/CHoCH, **engulfing candles**, Fibonacci and session shading.
- Nothing here repaints. A level appears from the candle that confirmed it, not the candle it turns out later to have begun on.

4

Work the checklist honestly

This is what you can see and the engine cannot. It is also the one place in this app where you can lie your way to a green verdict.

1

Market context

What kind of market is this, and which way is it leaning?

MARKET CONTEXT

☐

Higher-timeframe trend identified

AI: detected · high

You have looked at D1 and H4 and can say what they are doing.

☐

H4 structure identified

AI: detected · high

Last H4 break was a BOS or a CHoCH, and you know which.

☐

H1 structure identified

AI: detected · high

Same question one timeframe down.

☐

Market regime identified

AI: detected · high

Trending, ranging, expanding or coiled — they are not traded the same way.

☐

Trending market

AI: not seen

Structure is breaking one way repeatedly.

☐

Ranging market

AI: detected · medium

Price is rotating between two edges.

☐

Expansion phase

AI: not seen

Ranges are widening — stops need more room.

☐

Consolidation phase

AI: not seen

Coiled and quiet — breakouts fail here often.

☐

Bullish bias

AI: not seen

Screen continues below — scroll in the app.

- Tick only what you can genuinely point at on the chart. The engine shows what *it* detected beside each item, so you can see where you disagree with it.
- Some items are mandatory. Without them the verdict is a no-trade regardless of everything else.
- A high score built on ticks you did not earn is worth less than an honest low one. Nothing checks your answers.

5

Read the verdict — including the case against

One score out of a hundred, with the reasoning shown in full and the objections stated as plainly as the support.

AI PRE-TRADE ANALYSIS

NO TRADE

60/100 · MODERATE

No trade. This is the FOMC Rate Decision release slot. If it is scheduled today it lands within ~15 min — spreads widen and stops get hunted, so stand down unless you have checked a live calendar. (from the recurring release schedule — VERIFY ON A LIVE CALENDAR.)

HTF BIAS
MIXED

EXECUTION
M15

SETUP
LIQUIDITY SWEEP +
CHOCH

STATUS
WAITING

⚠ **CONFLICT** — Higher timeframes disagree with each other. D1 and H4 are pointing opposite ways, so there is no higher-timeframe wind at your back. Size this as a counter-trend probe, not a conviction trade.

D1: bullish · BOS ↑ · trending
H4: bearish · CHoCH ↓ · ranging
H1: bullish · MSS ↑ · ranging
M30: bearish · CHoCH ↓ · ranging
M15: bearish · CHoCH ↓ · ranging

WHY THIS READING

1. One higher timeframe is bearish and the other is not, so the wind is only partly behind this.
2. Equal highs ×2 at 4383.14 was taken and rejected 1 bar ago — the stops behind it are gone.
3. M15 changed character downward through 4380.06.
4. A breaker block sits at 4390.75–4393.28, which is where price would have to come back to.
5. That area sits in discount, which is not the ideal half of the range for a sell. It costs points rather than disqualifying the idea.
6. The stop at 4398.33 sits beyond the last confirmed swing, plus a 15% ATR buffer — 1.0× ATR away, so normal movement should not reach it.

Screen continues below — scroll in the app.

- Ten weighted factors — structure, liquidity, imbalance, order blocks, price action, higher timeframe, location, momentum, session and reward-to-risk — are summed into the score.
- Some conditions **override** the score entirely: news inside your window, spread above your threshold, the desk shut on a daily limit, no placeable stop, or reward-to-risk below your minimum.
- A no-trade is not a prediction that the setup would have lost. It is the app holding you to limits you set earlier.

Worth knowing. The score is not a probability of profit. An 80 does not mean eight of the next ten win. It means eight-tenths of the conditions this rulebook looks for were present.

6

Take the plan: entry, stop, targets, size

Every level comes from something on the chart. The lot size comes from the loss you already said you could accept.

STEP 8 • THE PLAN

Trade plan

No trade plan

This is the FOMC Rate Decision release slot. If it is scheduled today it lands within ~15 min — spreads widen and stops get hunted, so stand down unless you have checked a live calendar. (from the recurring release schedule — VERIFY ON A LIVE CALENDAR.)

- The **stop** sits beyond the level that would prove the idea wrong, padded by a fraction of ATR so ordinary noise cannot reach it. The card names which level it used.
- The **targets** are drawn from real structure — opposite liquidity, an unfilled gap, a prior session high — and spaced so three targets cannot hide inside a single ATR. One marked *projected* has no structure behind it.
- The **size** is worked backwards from your risk percentage. Confirm the broker contract specification once; until you do it is marked *assumed*, and an assumed spec means an assumed lot size.

7

Ask the assistant

It explains what the engine measured. It never does the measuring, and it cannot tell you where price is going.

ASK ABOUT THIS SETUP

Gemini

Why is this blocked?
What would have to change?
What does the confluence score mean?

Ask about this analysis...
Ask

Write a brief
Compare my broker's chart

A screenshot of your own broker's XAUUSD chart is checked against these levels — the app's candles are a proxy, and a disagreement between the two is worth knowing about before you place anything.

- Ask why a setup was blocked, what would have to change, or where the weakest part of it is. Answers arrive instantly, computed on your device.
- Ask what the score means, where the stop came from, or how the daily limits work. It answers from a fixed set of topics and says so when it does not have one.
- Ask it where gold is going and it will decline. Nothing in this app forecasts, and the assistant is not a loophole in that.

Worth knowing. Any price in a reply that the engine did not compute is flagged with a warning above the answer, before you read it.

8

Place it yourself, with your broker

There is no button here that sends an order, and there is not going to be one.

Screen continues below — scroll in the app.

- Copy the entry, stop and targets into your own platform by hand. The few seconds that takes are the last checkpoint between an idea and a live position.
- Verify the price on your broker before you commit, especially on a proxy feed. Use **Compare my broker's chart** to check a screenshot of your platform against these levels.
- The app never sees your broker, your balance or your orders. It has no API key, no connection and no way to act for you.

Log it — win, lose or skipped

The journal is the only part of this app that gets more useful the longer you use it.

Screen continues below — scroll in the app.

- Save the plan whether or not you take the trade. The ones you passed on are data too, and they are the ones that show whether your discipline is working.
- Close it out later with the result and the emotion you felt at the time. Honest inputs or the statistics are decoration.
- The dashboard, the psychology read and the progression path all read from here, and all three are empty until you have logged real trades.

Watch the path, not the day

Six stages, in the order that actually works: record, defined risk, discipline, selectivity, positive expectancy, consistency.

Screen continues below — scroll in the app.

- Your stage is the first one you have *not* met — not the best one you ever touched. A cleared stage can close again, and that is the point.
- Expectancy sits fifth deliberately. Chasing it before the four habits underneath it are in place is the most common way traders stall for years.
- The dashboard breaks results down by session, by score band and by recorded emotion. Patterns show up here that no single trade ever reveals.

Where the responsibility sits

This app can tell you that a setup breaks your own rules. It cannot tell you whether the trade will work, and it will never claim to. The score is a count of conditions met against a fixed rulebook — not a probability, not a forecast, and not a recommendation.

Its value is mostly in the trades it stops you taking. That is an unglamorous thing to sell and the honest thing to say.

If something is unclear

Open the assistant — the  button on any screen — and ask. It answers on your device, needs no connection, and covers everything in this document. The **Guide** screen inside the app repeats these steps with live examples from your own settings.

Risk warning and disclaimer. BullionEdge Pro is analytical and risk-management software for the XAU/USD market. It is not financial, investment, tax or legal advice; it is not a broker, fund or account-management service; and it is not a signal service that guarantees any outcome.
